Теория

(сюда будут ссылки)

1. Многочлен $P_n(x) = a_0 + a_1x + \dots + a_{n-1}x^{n-1} \longleftrightarrow (a_0, \dots, a_n) = P_n$ (порядок коэффициентов как на семинаре, а не как в задании). Считаем $\exists l \in \mathbb{N} \cup \{0\} : n = 2^l$.
2. $\omega_n^k \stackrel{\text{def}}{=} e^{\frac{2\pi k}{n}i}$
3. $\varphi(P) \stackrel{\text{def}}{=} (P_n(\omega_n^0), \dots, P_n(\omega_n^{n-1}))$ — дискретное преобразование Фурье
4. $P_n^0 \stackrel{\text{def}}{=} (a_0, a_2, a_4, \dots)$, $P_n^1 \stackrel{\text{def}}{=} (a_1, a_3, a_5, \dots) \Rightarrow$ свойство: $P_n(x) = P_n^0(x^2) + x \cdot P_n^1(x^2)$. Следствия :
 - (a) $P_n(\omega_n^j) = P_n^0(\omega_{n/2}^j) + \omega_n^j P_n^1(\omega_{n/2}^j)$, $0 \leq j < \frac{n}{2}$
 - (b) $P_n(\omega_n^{\frac{n}{2}+j}) = P_n^0(\omega_{n/2}^j) - \omega_n^j P_n^1(\omega_{n/2}^j)$, $0 \leq j < \frac{n}{2}$
5. $n = 1 \Rightarrow \varphi(P_n) = \varphi((a_0)) = (a_0)$
6. Обозначаем $\varphi(A) = \alpha$, элементы кортежей как $(a_0, \dots, a_{n-1})[i] = a_i$.
7. Тогда 4 $\Rightarrow \begin{cases} \alpha[j] &= \alpha^0[j] + \omega_n^j \alpha^1[j] \\ \alpha[n/2 + j] &= \alpha^0[j] - \omega_n^j \alpha^1[j] \end{cases}$
